MEETING NOTES

IIM Group Project

FMCG Supply Chain Project — Session 2

Friday, 12 June 2026 · 9:01 – 10:00 PM

Arjun · Priya · Rohan · Nandini · Vikram

ABOUT THIS DOCUMENT

What each section contains

Executive Summary	A 3-sentence snapshot of what was decided and what happens next — for stakeholders who need the outcome without the detail.
Decisions Made	Every decision reached in the meeting, with the reasoning or context behind it. Prevents re-litigation later.
Action Items Table	Structured table: Action | Owner | Due Date | Priority. One source of truth for accountability.
Open Questions	Unresolved issues that need answers before or at the next meeting — so nothing falls through the cracks.
Follow-up Email	Ready-to-send recap email for all attendees. Builds a reputation for the person who sends it.

SECTION 1

3-Line Executive Summary

1 The team finalised Winter's exponential smoothing as the primary demand forecasting model, with exponential smoothing as a sensitivity-analysis fallback, acknowledging that only 2 years of historical data limits reliability.

2 EOQ was set at ~840 units (to be rerun with the supplier's 5% discount above 1,000 units), and safety stock was provisionally calculated at 120 units at 95% service level — both pending cross-verification by Rohan.

3 Report and presentation responsibilities were divided across all five members, with all model outputs due Monday EOD and a full-draft review meeting set for Wednesday 9 PM before Thursday submission.

SECTION 2

Decisions Made

- **Winter's model selected as primary forecasting method**

  Chosen for its seasonality handling (Diwali, Holi spikes); the 2-year data limitation to be documented explicitly in the report as an assumption.

- **Exponential smoothing retained as sensitivity/fallback model**

  Nandini's dual-model proposal to pre-empt Prof. Deshpande's expected questions on assumptions and robustness.

- **Quantity discount scenario to be included in EOQ analysis**

  Case data shows a 5% supplier discount above 1,000 units — Arjun confirmed this materially changes the cost equation.

- **Supply chain risk section added as a differentiator**

Covers stockout risk, supplier dependency, and disruption scenarios — flagged by Prof. Deshpande in class as a value-add.

- **Presentation capped at 12 slides for a 15-minute slot**

  Constraint set after the previous group overran and visibly irritated the professor.

- **Next meeting: Wednesday 9 PM to review full draft before Thursday submission**

  Unanimously agreed by all five members at end of call.

SECTION 3

Action Items

Action | Owner | Due Date | Priority — one source of truth for accountability.

Action	Owner	Due Date	Priority
Rerun EOQ with 5% quantity discount; compare total annual costs; prepare slide	Vikram	Mon Jun 16 EOD	**High**
Cross-check safety stock (120 units, 95% SL, 7-day LT, SD ≈ 38 units/day)	Rohan	Sun Jun 15	**High**
Draft intro and problem statement section of the report	Nandini	Mon Jun 16 EOD	**Medium**
Write forecasting section (Winter's model, formulas, sensitivity analysis)	Priya	Tue Jun 17 EOD	**High**
Build presentation deck (12 slides max)	Arjun	Wed Jun 18, 9 PM	**High**
Write supply chain risk section (stockout risk, supplier dependency, disruptions)	Vikram	Mon Jun 16 EOD	**Medium**
All model outputs submitted to Priya for report integration	All	Mon Jun 16 EOD	**High**

SECTION 4

Open Questions

? Does the validated safety stock figure (Rohan's cross-check) match Priya's estimate of 120 units? If not, which assumption needs revisiting — lead time, service level, or demand SD?

? After including the 5% quantity discount, does the optimal order quantity shift above 1,000 units, and how does this affect total annual cost?

? How should the limitations section frame the 2-year data constraint — as a model assumption or a data gap requiring future mitigation?

? Report structure agreed in principle, but individual section word limits / slide-to-section mapping not yet defined — to be resolved at Wednesday's review.

SECTION 5

Follow-up Email Draft

To: Priya Sharma, Rohan Mehta, Nandini Krishnan, Vikram Bhatia

Subject: Meeting recap + action items | FMCG Supply Chain Project

Hi everyone,

Thanks for a productive session tonight. Here's a quick recap so we're all aligned heading into the final stretch.

— Decisions —

• We're going with Winter's model as our primary forecasting method, with exponential smoothing as a sensitivity fallback. We'll document the 2-year data limitation clearly in the report.

• EOQ analysis will include the quantity discount scenario (5% above 1,000 units). Vikram will rerun and compare total annual costs.

• We're adding a supply chain risk section to differentiate our submission.

• Presentation: 12 slides max for our 15-minute slot.

• Next meeting: Wednesday 9 PM to review the full draft before Thursday submission.

— Action items —

Rohan → Validate safety stock (120 units, 95% SL, 7-day LT, SD ≈ 38) | Sun Jun 15

Vikram → Rerun EOQ with discount scenario + write risk section | Mon Jun 16 EOD

Nandini → Draft intro & problem statement | Mon Jun 16 EOD

All → Submit model outputs to Priya | Mon Jun 16 EOD

Priya → Write forecasting section of report | Tue Jun 17 EOD

Arjun → Build presentation deck (12 slides) | Wed Jun 18, before 9 PM

A reminder that Priya needs all model outputs by Monday EOD to write up the forecasting section properly — please treat that as a hard deadline.

See everyone Wednesday at 9!

Arjun
